## The Tsunami, One Year Later

Thursday, December 29, 2005

On December 26, 2004, entire regions of the Indian Ocean basin were devastated by giant waves of water, caused by an underwater earthquake in a volitile and active subduction zone. The world watched in horror as the scale of devastation became clear.

This week, <u>Scientific American</u> is out with a major report on the disaster that deserves reading. "<u>Tsunami: Wave of</u> <u>Change</u>" provides an overview of what we know — and what we don't know — about tsunamis.
